Description

- **AAV8-CMV-GFP** was produced in insect Sf9 cells by double infection with rBV-inCap8-inRep-kozak-hr2 and rBV-V545-CMV-GFP-hGHpA.

The vectors were purified through 2 rounds of CsCl ultracentrifugation. The CsCl was removed through buffer exchange with Amicon desalting columns. The vectors were then sterilized via filtration with 0.22 µm filters. The final buffer is 1XPBS containing 0.001% pluronic F-68.

These vectors are for research use only and not for any human purposes.

Quality Control Data

ITR-qPCR analysis was used to determine the titer(s) of the AAV sample(s). SDS-PAGE and InstantBlue Staining techniques were used to verify the purity of the vectors (Fig. 1). DNA agarose gel electrophoresis was used to verify genome quality (Fig. 2).
