Description

AAV9-Empty was produced in insect Sf9 cells by infection with rBV-V289-inCap9-inRep-kozak-hr2.

The vectors were purified through 2 rounds of CsCl ultracentrifugation. CsCl was removed through buffer exchange with Amicon desalting columns. The vectors were then sterilized via filtration with 0.22 μm filters. The final buffer is 1xPBS + 0.001% pluronic F-68.

These vectors are for research use only and not for any human purposes.

Capsid Titer

The titer of **AAV9-Empty** particles was determined by measuring the OD value with Nano Drop and plotting against a known AAV standard curve.

Quality Control Data

SDS-PAGE and InstantBlue Staining (Invitrogen) techniques were used to verify the purity of the vectors (Fig. 1). DNA agarose gel electrophoresis was used to verify absence of full AAV or for any visible DNA present (Fig. 2).
